Explanation for the maps of the Toolik Lake Area and the Toolik Lake Grid

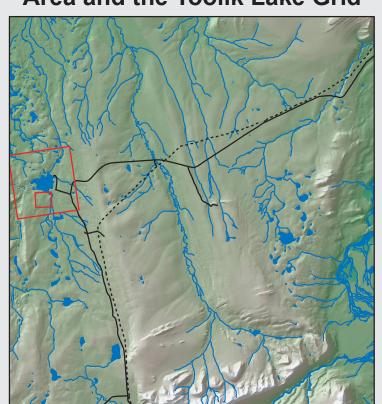

Figure 1. Location of the Toolik Lake Area (large red rectangle) and Toolik Lake Grid (small red rectangle) within the upper Kuparuk River region.

Vegetation of the Toolik Lake Area

Map F is located near the western boundary of Map A (displayed on front) and encloses a 20-km² area surrounding Toolik Lake that stretches from the Dalton Highway on the east to Jade Mountain on the west (large red rectangle in Fig. 1). It includes the Toolik Field Station, the old Toolik Lake pipeline construction camp gravel pad and airstrip on the northeast side of the lake and the primary errestrial research areas on the south, west and east sides of the lake, as well as several smaller research lakes in the immediate vicinity of Toolik Lake. The area contains surfaces with irregular opography that were glaciated during the Late Pleistocene (Fig. 2 and 3).

Map F portrays the physiognomy of the dominant plant communities in each mapped polygon. Fiftyone landcover types (GIS codes are in parentheses in the second column of the legend) were recognized in the field (minimum mapping unit approximately 250 m²). These were later grouped into the 14 physiognomic vegetation units on the map, which correspond to the same units on the 1:63,360-scale map of the upper Kuparuk River region (Map A).

Vegetation of the Toolik Lake Grid

Map G focuses on the 1.2-km² research grid on the south side of Toolik Lake (red rectangle on Map F and small red rectangle in Fig. 1). This area is one of the principal intensive research areas at the Toolik Lake Field Station. It includes many experimental research sites where long-term observations and experiments are being conducted, including the greenhouse and snow-fence experiments (Fig. 6-9). The grid was constructed in 1989 to provide geographic referencing for experimental plots and to provide a sampling scheme for periodic measurements of snow, active layer and plant communities.

Sixty-five plant communities were recognized (minimum mapping unit approximately 2.5 m²) in the field (GIS codes are in the second column of the legend) and were then grouped into the 24 units appearing on the map. The vegetation units are primarily at the plant-community level (compared to the physiognomic level for the maps of the Upper Kuparuk River Region and the Toolik Lake Area). Several of the dominant plant communities in the Toolik Lake area are shown in the photos (Fig. 10-16). Details of the methods for both maps, sources for aerial photos, orthophoto topographic map, ross-reference to the Braun-Blanquet syntaxonomic plant community names (Walker et al. 1994) and other information are on the Arctic Geobotanical Atlas website, http://www.arcticatlas.org/.

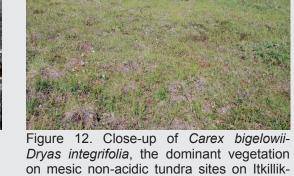

Typical Plant Communities

undra (Eriophorum vaginatum-Sphagnum spp.), the most common plant community on old, stable, acidic landscapes in the region. This is the dominant plant community in unit four on

Rhizocarpon geographicum, unit two on Map A, F and G.

age glacial surfaces, unit five on maps A, F

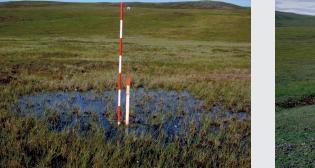

Figure 13. Fen with Carex aquatilis-C. Figure 14. Dry south-facing slope on kame chordorrhiza, a major component of unit with Dryas octopetala-Selaginella sibirica, seven on Map A and F, and unit nine on unit nine on Map A, F, and unit 13 on Map G.

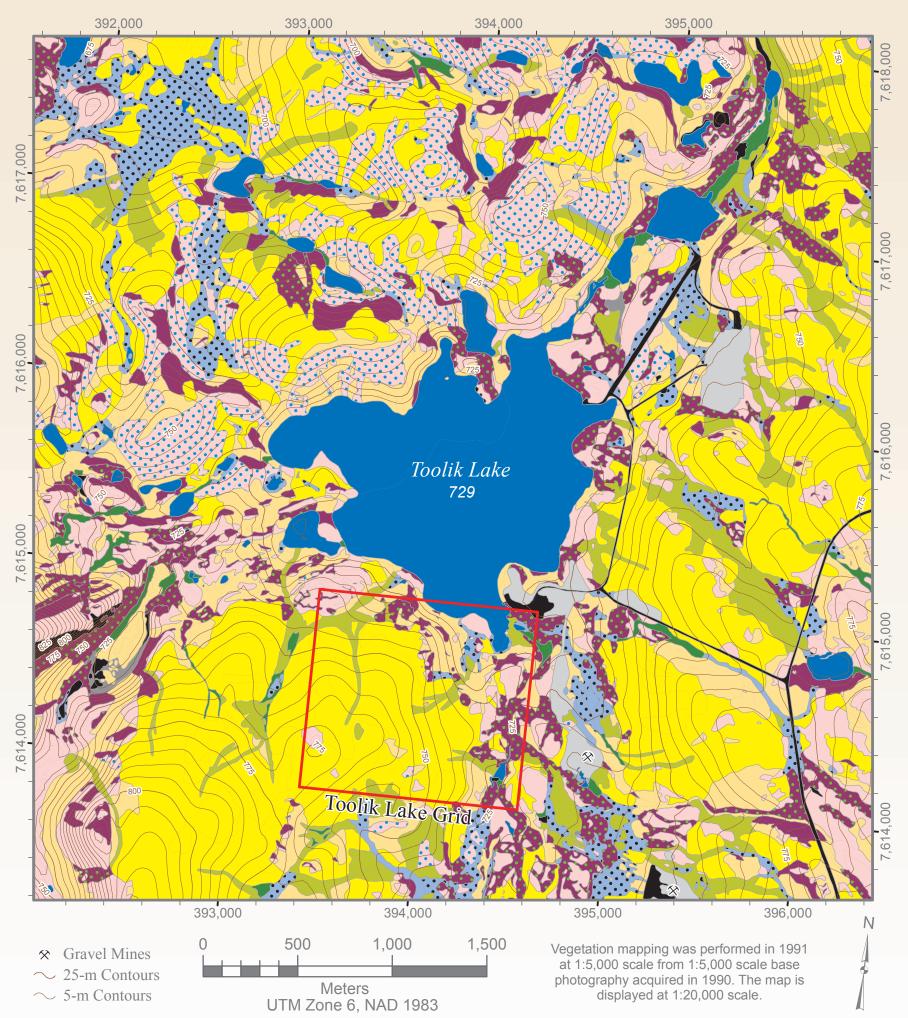

component of unit 11 on Map A and F and unit 17 on Map G.

Figure 15. Deep, late-melting snowbed with Figure 16. Well-developed water track with Salix rotundifolia (at stake). Dark-colored Salix pulchra-Eriophorum angustifolium, a egetation above the stake is Cassiope common component of map unit 14 on Map tetragona-Dryas integrifolia, a common A and Map F and unit 23 on map G.

All photos are by D.A. Walker except figures 6 and 7 which are courtesy of the Arctic LTER website http://ecosystems.mbl.edu/ARC/terrest/maps_photos/index.html).

F: Toolik Lake Area Vegetation

Physiognomy		Plant Communities (GIS codes)	Typical Microsites		% of Map
Barren					
1.	Barren	Unvegetated (91, 101).	Unvegetated natural and anthropogenic barrens.	23.8	1.2
2.	Lichens on rocks	Lichen communities on rocks, including <i>Cetraria nigricans-Rhizocarpon geographicum</i> (92).	Xeric blockfields, glacial erratics.	3.9	0.2
3.	Partially vegetated barrens and revegetated disturbed areas	Revegetated gravel pads (e.g., Festuca rubra or Salix alaxensis 102).	Partially vegetated disturbed barrens on gravel pads, abandoned roads, bulldozed areas.	24.9	1.2
Moist gra	aminoid tundra				
4.	Tussock sedge, dwarf-shrub, moss tundra	Moist acidic tussock tundra complexes dominated by graminoids. Dominant plant communities include: <i>Eriophorum vaginatum-Sphagnum</i> (41) and <i>Carex bigelowii-Sphagnum</i> (no code).	Mesic to subhygric, acidic, shallow to moderate snow. Stable slopes. Some areas on steeper slopes with solifluction are dominated by Bigelow sedge (<i>Carex bigelowii</i>) (no code).	605.1	29.8
5.	Nontussock sedge, dwarf-shrub, moss tundra	Moist nonacidic tundra complexes. Dominant plant communities include: Carex bigelowii-Dryas integrifolia (42) and other subtypes of this unit (e.g., Salix glauca (33), Equisetum arvense and Cassiope tetragona (no codes)). Includes some miscellaneous graminoid communities mostly on disturbed areas, such as Deschampsia caespitosa (45); Rumex arcticus-Carex saxatilis (75) Salix chamissonis-Carex aquatilis (65); Ramunculus pedatifidus-Poa glauca (104).	Mesic to subhygric, circumneutral, shallow to moderate snow. Solifluction areas and somewhat unstable slopes (42), mainly on Itkillik II glacial surfaces. Some south-facing slopes have scattered glaucous willow (<i>Salix glauca</i>) (33). Also includes some miscellaneous graminoid-dominated sites: deepsnow stream margins (65), landslides, some rocky drained lake basins (45, 75) and animal dens (104).	306.8	15.1
Wet gran	ninoid tundra and	water			
6.	Sedge, moss tundra (poor fens)	Nutrient-poor fen wetland complexes. Dominant plant communities include: Lower microsites: <i>Eriophorum scheuchzeri-Carex rotundata</i> (72). Raised microsites: <i>Sphagnum lenense-Salix fuscescens</i> (71).	Subhydric to hydric, acidic (pH < 4.5). Wet meadows, poor fens in colluvial basins – mainly on older (Itkillik I) glacial surfaces.	7.8	0.4
7.	Sedge, moss tundra (fens)	Nutrient-rich fen wetland complexes. Dominant plant communities include:	Subhydric to hydric, minerotrophic (pH > 4.5). Water tracks, stream margins, fens, flarks on	105.6	5.2
	`	Lower microsites: Carex aquatilis-Carex chordorrhiza (no code); Eriophorum angustifolium-Carex aquatilis (82), Carex aquatilis-Scorpidium scorpioides (74). Raised microsites: Trichophorum caespitosum-Tomentypnum nitens	solifluction slopes – mainly on younger (Itkillik II) glacial surfaces.		
		(73) and <i>Carex bigelowii-Dryas integrifolia</i> (42). Includes a few other miscellaneous wetland types.			
8.	Water and herbaceous marsh	Unvegetated water (84); graminoid marsh <i>Arctophila fulva</i> (81) and <i>Sparganium hyperboreus-Hippuris vulgaris</i> (83).	Lakes, ponds and streams; aquatic vegetation in some protected sites.	196.5	9.7

Plant Communities (GIS codes) Prostrate-shrub tundra 9. Prostrate dwarf-shrub, fruticose-Dryas octopetala-Selaginella sibirica (12); Arctous alpina-Hierochloë sites on glacial till, outwash, ridge tops, exposed 232.2 11.5 alpina, typical subtype (14), Salix phlebophylla subtype (no code) or slopes, dry river terraces. Vaccinium vitis-idaea subtype (17). 10. Prostrate dwarf- Dry nonacidic tundra complexes. Dominant plant communities include Xeromesic to mesic, nonacidic with shallow snow shrub, sedge, forb, *Dryas integrifolia-Oxytropis nigrescens* (13), *Dryas integrifolia-O.* cover. Exposed sites on dry river terraces, recent fruticose-lichen maydelliana (no code), Dryas integrifolia-Astragalus umbellatus (16), alluvium (13); dry microsites in nonsorted-stripe tundra (nonacidic) Dryas integrifolia-Dicranum elongatum (18) and undifferentiated complexes (16, 18). Dominated by Dryas integrifolia. Snowbed communities dominated by either *Cassiope tetragona* or Includes all snowbed types. Salix rotundifolia (20). These communities are not differentiated at dwarf-shrub, forb, this scale, but include Cassiope tetragona-Carex microchaeta (acidic moss, fruticose-sites); Cassiope tetragona-Dryas integrifolia (nonacidic sites); Salix rotundifolia-Sanionia uncinata (deep snowbeds). lichen tundra Dry or moist shrublands with very low-growing or creeping dwarf- Subxeric to mesic, acidic, with shallow snow. . Hemi-prostrate shrubs. Dominant plant communities include Betula nana-Hierochloë Shallow depressions on dry glacial till or outwash. dwarf-shrub, alpina (23); Salix pulchra-Hierochloë alpina (24); and those fruticose-lichen dominated by Ledum palustre ssp. decumbens, Empetrum nigrum or tundra Vaccinium uliginosum (no codes). Erect-shrub tundra Moist acidic tundra complexes dominated by shrubs, including Mesic to subhygric, moderate snow. Lower slopes low-shrub, sedge, shrubby tussock tundra. Dominant plant communities include Betula and upland water-track margins (43, 52), often with nana-Eriophorum vaginatum (43) and Salix pulchra-Carex bigelowii solifluction (44). Or palsas and high-centered (44). Also dwarf-shrub tundra dominated by dwarf birch or willows. polygons (51). Dominant plant communities include Betula nana-Rubus chamaemorus (51) and Salix pulchra-Sphagnum (52). 14. Low and tall A wide variety of low to tall shrublands. Dominant plant communities Low shrubs in upland water tracks (66, 67), include those growing in upland water tracks such as *Salix pulchra*-streamsides (61, 62, 63) and south facing slopes (52, Eriophorum angustifolium (67) and Eriophorum angustifolium-34), mesic to subhydric, often with deep snow. Sphagnum squarrosum (66); those growing along streams such as Salix pulchra-Dasiphora fruticosa (61) and other low (5122) and tall shrublands (5121); upland shrublands dominated by Salix glauca (33) and/or *Alnus crispa* (52) or *Populus balsamifera* (34) and shrublands on river gravels dominated by feltleaf willow (*S. alaxensis*) (63) or lanate willow (S. richardsonii) (62).

Typical landscapes in the Upper Kuparuk River region:

Figure 2. View looking northeast from Jade Mountain across an Itkillik II glacial landscape with numerous glacial lakes, kames and kettles. This landscape is much more vegetatively complex than the Sagavanirktok-age glacial surfaces (Fig. 3

Figure 3. View looking southeast across the headwaters of Imnavait Creek into the Philip Smith Mountains of the Brooks Range. Vegetation is typical of the Sagavanirktok-age glacial surfaces, which cover large portions of Map A but do not occur on the terrain shown in Maps F and G.

Figure 4. Alpine area on limestone on Peak 1376 in the southeast corner of Map A, looking south into the valley of the Sagavanirktok River. The dominant vegetation is *Dryas integrifolia-Oxytropis* nigrescens (unit 10 on Map A)
